(320)286-2470

Net Weight – 2,000 lbs.

Pelleting Process:

1. Chicken manure is collected on a belt conveyor system
2. Manure is dried to roughly 15% moisture
3. Final step, manure enters pellet mill where it undergoes pelleting process
 - a. During this step, nutrients are not added to the manure to boost the analysis
 - b. There are no bonding agents added to the manure to help it stick together, rather this is accomplished from the slight bit of moisture left in the manure prior to pelleting
